Investment portfolio as of August 31, 2022

Chart 1. Portfolio value

Chart 2. Asset allocation

Chart 3. Portfolio risk

Expected volatility: 14.3%

¹ Total Public Equity includes the following sub-units: Global Equity, SISS and Innovation GE.

Total fund risk and asset allocation as of August 31, 2022

The Risk team utilizes the BlackRock Aladdin risk management system for the total plan portfolio. According to the BlackRock risk model, approximately 53% of the total risk in the CalSTRS Investment Portfolio comes from Public Equity, versus an approximately 38% asset weight. Public Equity risk and Private Equity risk combined now comprise over 80% of portfolio risk. Portfolio risk increased significantly due to spiked market volatility in March and April 2020 and it remains elevated but has decreased significantly from its peak.

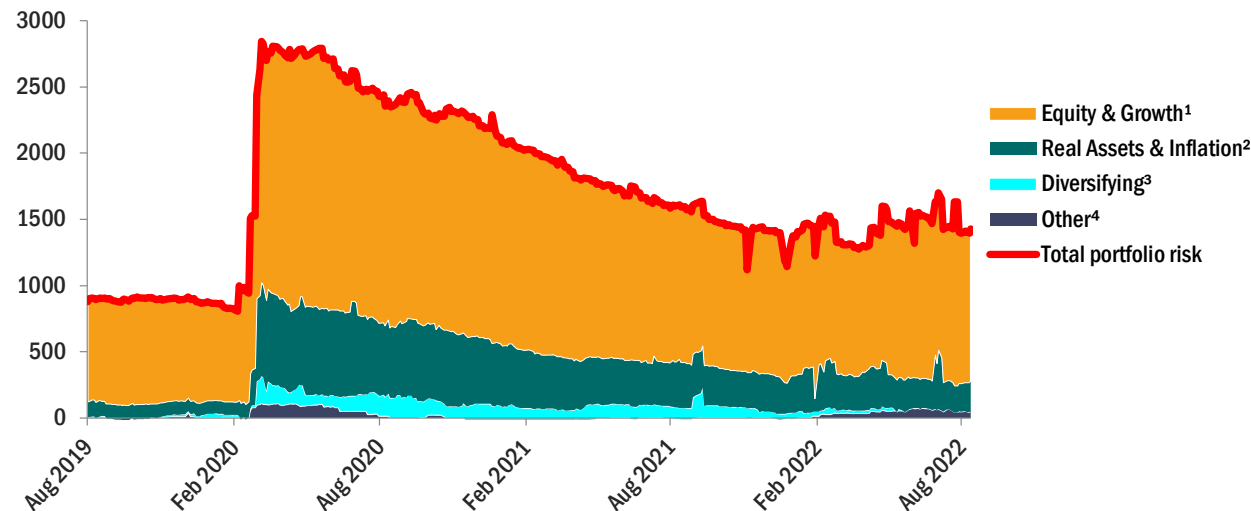

Chart 5. Sources of portfolio risk

¹ Equity & Growth includes Total Public Equity and Private Equity.
² Real Assets & Inflation includes Real Estate and Inflation Sensitive.
³ Diversifying includes Risk Mitigating Strategies, Fixed Income & Cash.
⁴ Other includes Innovative Strategies and Strategic Overlay.

CalSTRS market exposures

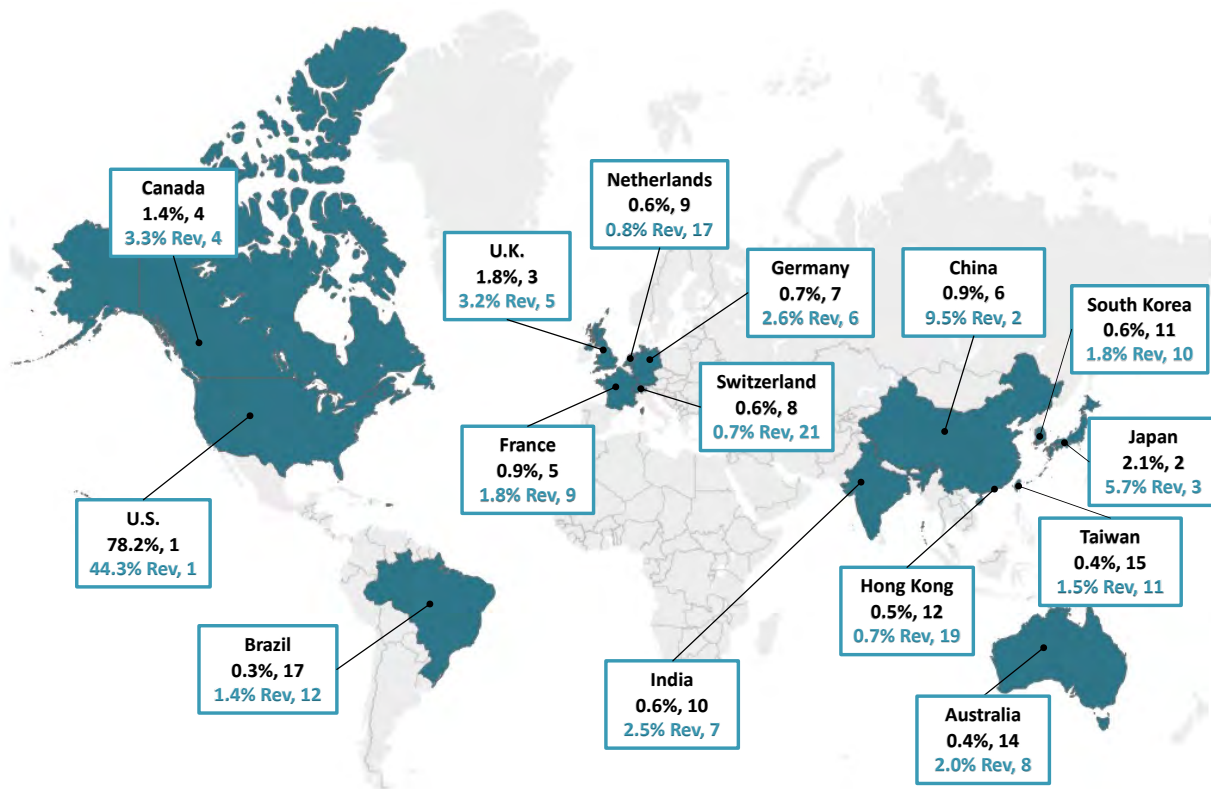

Across all asset classes, the fund has significant market value exposure to the U.S. and Europe. However, market value exposure is only one way to measure geographic concentration. Publicly traded companies report sources of revenue by country, making it possible to compare the market value exposures of the portfolio to the revenue exposures of a public equity benchmark.

The map below compares the top 10 exposures by market value of the total CalSTRS Investment Portfolio to the top 10 exposures by revenue of the CalSTRS Custom Global Equity benchmark. The U.S. comprises 78.2% of the fund market value, versus 44.3% revenue exposure for the CalSTRS Global Equity benchmark.

The difference between market value exposure and revenue exposure underscores the global footprint of publicly traded multinational companies.

China is particularly notable for the difference between market value exposure and revenue exposure. China is a relatively small market value exposure in the total portfolio but is the second-largest source of revenue for publicly traded companies. When using revenue exposure to measure geographic concentration, the U.S. becomes relatively less important, the relative importance of some European countries changes, and some emerging markets become relatively more important, particularly China and Brazil.

Real Estate

At the July 2021 Investment Committee meeting, the committee approved a new CalSTRS Real Estate Investment Policy. The policy sets limits on Real Estate leverage depending on CalSTRS' level of control. Controlled structures have a leverage limit of 50% and are typically separate accounts and joint ventures where CalSTRS is the majority investor. Non-controlled structures have a leverage limit of 65% and are typically commingled funds where CalSTRS is a minority partner with typical limited-partner rights.

Real Estate data is based on CalSTRS' share of gross asset value as of March 31, 2022.

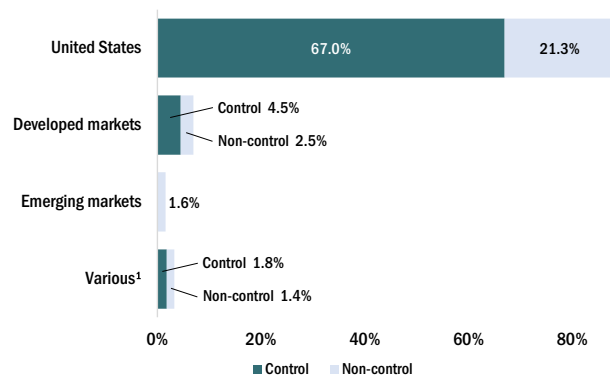

Chart 31. Property type exposure

¹ Various investments have properties in multiple countries that could be in multiple regions.

² Other property type includes diversified investments that include multiple property types and all other property types (for example, hotels or land).

Private Equity¹

Chart 32. Sector exposure

Table 1. Top 10 portfolio company exposure

Company	Investment vehicle	Market value (millions)	% of Private Equity
1	Funds	\$497	1.01%
2	Co-Investments & funds	\$493	1.01%
3	Co-Investments & funds	\$397	0.81%
4	Co-Investments & funds	\$319	0.65%
5	Co-Investments & funds	\$261	0.53%
6	Co-Investments & funds	\$253	0.52%
7	Co-Investments & funds	\$231	0.47%
8	Co-Investments & funds	\$224	0.46%
9	Co-Investments & funds	\$219	0.45%
10	Co-Investments & funds	\$217	0.44%

Chart 33. Geographic exposure

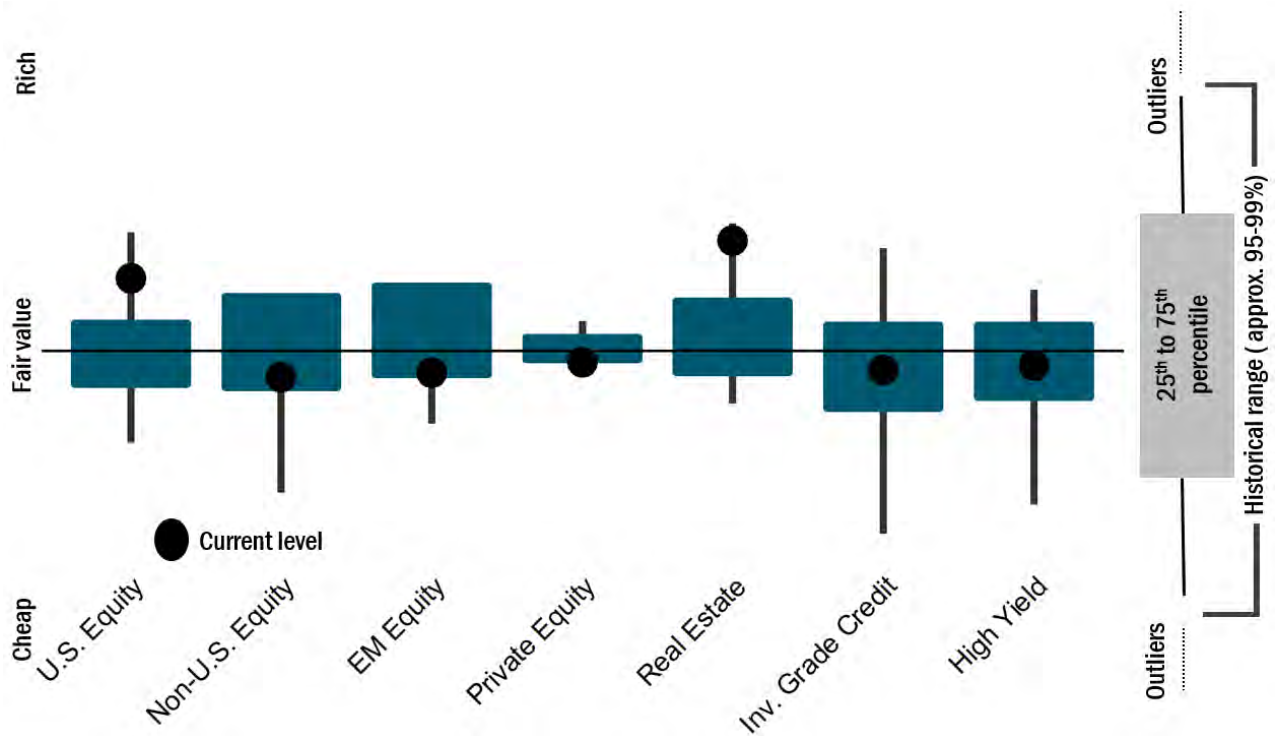

¹ Private Equity Portfolio company level data as of March 31, 2022.

² Various includes investments in which the sector or geography data is not available at the level of detail of the dataset.

Valuations

For most of the larger asset classes in the portfolio, the price of the asset at any given time is an important component of expected return, particularly over the medium term (three to five years). Higher prices tend to precede periods of lower returns, an important consideration for the risk-return opportunities across the portfolio. Chart 34 shows several common measures of valuation converted to a common scale for comparability. In the past few months, the valuations for emerging market equity, private equity and investment grade credit have decreased while the valuations for real estate have increased. U.S. equity continues to have a higher valuation than non-U.S. developed and emerging market equity.

Chart 34. Asset class valuations

Valuation metrics: Long-Term P/E Ratio for Public Equity; Total Value/EBITDA for Private Equity; Transaction Cap Rate for Real Estate; Credit spreads for Inv. Grade and HY Credit.

Market volatility

The volatility index presented in Chart 35 and Chart 36 is an indicator of general market turbulence. The red lines provide a threshold by which to judge whether a day is an outlier or not. The long-term chart shows that, historically, periods of higher turbulence tend to cluster in time. The clustering of turbulent periods means that if a particular day is an outlier, the following day is much more likely to be an outlier. Several days in a row of outliers are a strong indicator that market turbulence could persist for many weeks or months. Economic concerns over persistent inflation, aggressively rising interest rates and slowing global growth are the major causes of ongoing turbulence.

Chart 35. Market turbulence—long term

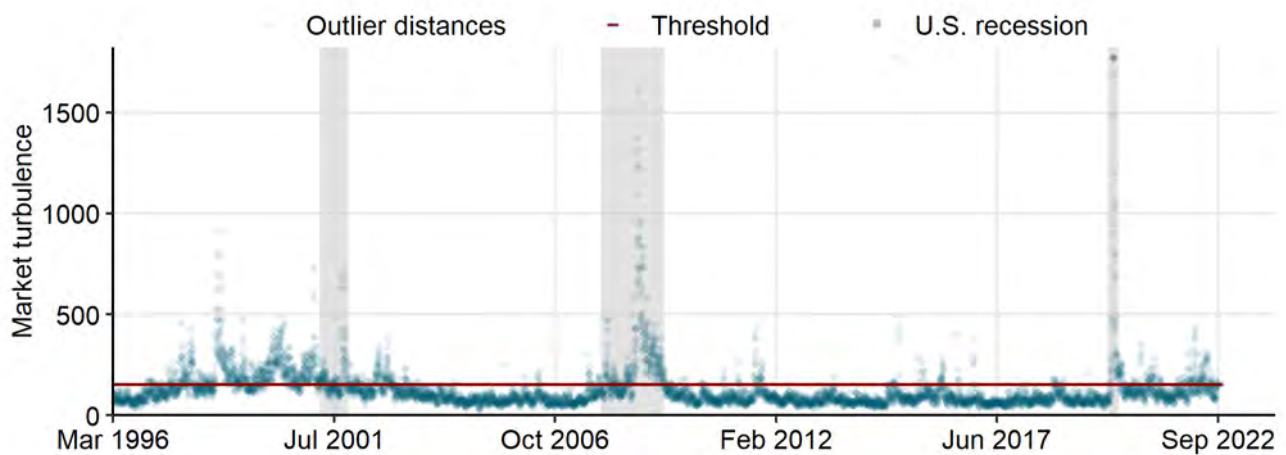

Chart 36. Market turbulence—recent

Fund liquidity

Paying timely benefit payments is a key objective that requires an appropriate level of cash or liquid assets that can be readily converted to cash. To ensure the fund has an appropriate level of liquidity, the Investment Policy specifies minimum levels of cash and other liquid assets. In addition to required policies, the Risk Allocation Committee manages portfolio rebalancing and timing in order to ensure cash is available when needed. A convenient framework for measuring how much liquidity is available is to break down the assets into multiple tiers:

- Cash.
- Tier 1 assets: Securities that trade frequently and can be readily converted to cash.
- Tier 2 assets: Generally liquid securities that can still trade at prevailing price levels even in periods of modest market stress.
- Less liquid assets: Securities that are by their nature illiquid, such as Private Equity Portfolio partnerships and otherwise liquid assets that become illiquid in periods of stress.

Table 2 shows the liquidity profile of the total portfolio. The combination of cash and Tier 1 assets provide a substantial cushion to ensure timely benefit payments, even in periods of extended market stress.

Table 2. Fund liquidity

Asset	Portfolio value (billions)	Months of benefit payments
Cash	\$6.0	4.1
Tier 1 assets	\$147.4	102.4
Tier 2 assets	\$8.6	6.0
Less liquid assets	\$114.1	79.3
